

EMPLOYEE WELLNESS DASHBOARD REPORT

1. EXECUTIVE SUMMARY

Employee wellness has emerged as a critical factor influencing productivity, engagement, and organizational success. This report presents an analytical overview of employee wellness using a data-driven approach, focusing on key indicators such as energy levels, engagement, burnout risk, and sustainability.

The analysis reveals that a significant proportion of employees fall under the **moderate burnout category (~61%)**, indicating a need for proactive wellness strategies. Additionally, approximately **7% of employees are identified as high-risk**, requiring immediate intervention.

Energy levels across employees indicate a predominance of **mild fatigue and low energy states**, which may impact productivity and engagement. Overall wellness scores such as Weekly Energy Score (WES) and Employee Engagement Index (EEI) reflect a **moderate wellness environment**, suggesting room for improvement.

The Power BI dashboard developed provides an interactive and comprehensive view of these metrics, enabling stakeholders to monitor trends, identify high-risk individuals, and implement targeted interventions.

2. OBJECTIVE OF THE STUDY

The primary objectives of this analysis are:

- To assess overall employee wellness using quantitative metrics
- To identify employees at risk of burnout
- To analyze energy and engagement levels across the workforce
- To support data-driven decision-making for HR and leadership
- To design an interactive dashboard for continuous monitoring

3. DATA OVERVIEW

The dataset used for this analysis consists of employee-level records capturing various wellness indicators. Each record represents an individual employee with multiple attributes.

Key Variables:

- **User_ID**: Unique identifier for each employee
- **WES (Weekly Energy Score)**: Indicates weekly energy level (0–100)
- **EEI (Employee Engagement Index)**: Measures engagement (0–100)
- **BRS (Burnout Risk Score)**: Indicates burnout risk (0–100)

- **ARS (Attention Risk Score):** Reflects attention-related concerns
- **Sustainability Score:** Measures long-term wellness sustainability

Derived Fields:

- **WES_Category:**
 - Stable
 - Mild Fatigue
 - Low Energy
 - Burnout Risk
- **BRS_Category:**
 - Low
 - Mild
 - Moderate
 - High

These derived categories enable better segmentation and visualization of employee wellness levels.

4. METHODOLOGY

The analysis was conducted using **Power BI**, following these steps:

Data Preparation:

- Imported dataset into Power BI
- Cleaned and validated data
- Created calculated columns for categorization

Data Modeling:

- Organized data into structured format
- Defined relationships between tables (if applicable)

Visualization:

- Created KPI cards for key metrics
- Designed charts for distribution analysis
- Built slicers for interactive filtering

Metrics Used:

- Average scores for KPIs
- Count of users for distribution analysis

- Category-based segmentation

5. DASHBOARD OVERVIEW

The dashboard is divided into multiple components for clarity and usability:

5.1 KPI Cards:

- Average WES
- Average EEI
- Average BRS
- Average Sustainability
- Average ARS

These provide a quick snapshot of overall employee wellness.

5.2 Burnout Risk Distribution:

A pie chart showing the proportion of employees across burnout categories.

Insight: Majority fall under Moderate category, with a smaller segment in High-risk.

5.3 Energy Distribution:

A bar chart representing the number of employees across energy levels.

Insight: Most employees fall under Mild Fatigue and Low Energy categories.

5.4 High-Risk Users Table:

Displays employees with high burnout risk scores.

Purpose: Enables targeted intervention.

5.5 Slicers:

- BRS Category
- WES Category

These allow dynamic filtering of the dashboard for customized analysis.

6. KEY INSIGHTS

The analysis reveals several critical insights:

6.1 Burnout Trends:

- Approximately **61% of employees are in Moderate burnout category**
- Around **7% are in High burnout category**
- Indicates widespread medium-level stress across workforce

6.2 Energy Levels:

- Majority of employees fall under:
 - Mild Fatigue
 - Low Energy
- Suggests reduced productivity potential

6.3 Engagement Levels:

- Average EEI indicates moderate engagement
- Scope exists to improve employee involvement

6.4 High-Risk Identification:

- High-risk users ($BRS \geq 60$) identified
- These users require immediate attention

6.5 Overall Wellness:

- Combined metrics suggest a **moderate wellness environment**
- Preventive measures can significantly improve outcomes

7. BUSINESS IMPACT

The findings have important implications for organizational performance:

- Reduced energy and engagement can impact productivity
- High burnout may lead to absenteeism and attrition
- Moderate burnout indicates hidden stress levels

- Early intervention can reduce long-term costs

8. RECOMMENDATIONS

Based on the analysis, the following actions are recommended:

8.1 Immediate Actions:

- Provide support to high-risk employees
- Conduct wellness check-ins

8.2 Medium-Term Strategies:

- Introduce engagement programs
- Improve work-life balance initiatives
- Conduct stress management workshops

8.3 Long-Term Initiatives:

- Implement continuous wellness monitoring
- Use data-driven HR strategies
- Promote a healthy organizational culture

9. LIMITATIONS

- Data represents a snapshot in time
- External factors (workload, personal stress) not included
- Scores depend on data accuracy

10. CONCLUSION

This report highlights the importance of monitoring employee wellness using data-driven tools. The Power BI dashboard provides a comprehensive and interactive platform to analyze key metrics such as energy, engagement, and burnout risk.

The findings indicate that while the overall wellness environment is moderate, there is a clear need for proactive interventions, especially for high-risk employees.

By leveraging these insights, organizations can enhance employee well-being, improve productivity, and foster a healthier work environment.

11. FUTURE SCOPE

- Integration with real-time data sources
- Predictive analytics for burnout detection
- Department-wise and role-based analysis
- AI-driven recommendations

12. PREDICTION AND FUTURE OUTLOOK

Based on the current trends observed in the dashboard, several forward-looking predictions can be made regarding employee wellness and organizational impact.

12.1 Burnout Risk Projection

Given that approximately **61% of employees are currently in the Moderate burnout category**, it is highly likely that a portion of these employees may transition into the **High-risk category** if no intervention is implemented.

If the current trend continues:

- The High burnout segment (currently ~7%) may increase significantly in the coming months
- Moderate burnout users represent a **potential risk pool**

12.2 Energy Level Trend

The distribution shows a concentration in:

- Mild Fatigue
- Low Energy

Prediction:

- Without corrective actions, overall energy levels may decline further
- Increased fatigue may lead to reduced productivity and engagement

12.3 Engagement Forecast

With average EEI around moderate levels:

- Engagement is stable but not optimal
- Lack of improvement initiatives may result in gradual disengagement

Prediction:

- Employee motivation and participation may decrease over time

- Risk of increased attrition in long term

12.4 High-Risk User Impact

Identified high-risk users (BRS $\geq$ 60) represent immediate concern.

Prediction:

- These users may experience burnout-related outcomes such as absenteeism or reduced performance
- Early intervention can significantly reduce this risk

12.5 Organizational Impact Forecast

If current patterns persist:

- Productivity levels may decline
- Employee satisfaction may decrease
- Healthcare and attrition-related costs may increase

However, with timely intervention:

- Burnout levels can be stabilized or reduced
- Engagement and energy levels can improve
- Overall organizational performance can be enhanced

12.6 Predictive Recommendation Strategy

To mitigate future risks, the following proactive approach is suggested:

- Monitor Moderate burnout users closely
- Introduce preventive wellness programs
- Track KPIs regularly through the dashboard
- Implement data-driven HR interventions

12.7 Conclusion of Prediction

The dashboard not only reflects the current state of employee wellness but also highlights **early warning signals**. The large proportion of moderate burnout users indicates a critical opportunity for intervention before the situation escalates.

By acting on these insights, the organization can shift from a reactive to a **proactive wellness strategy**.
